

## DRINKING WATER WARNING

Important information about your drinking water  
Please read or have someone translate it for you

### TESTS SHOW PERCHLORATE IN WATER SUPPLIED TO AQUARION WATER CUSTOMERS, MILLBURY, MA

Water sampling performed on the Millbury water supply on August 20, 2008 and reported to Aquarion officials on August 28, 2008, revealed a level of **10.2** parts per billion (ppb) of perchlorate at the Millbury Avenue Well. The Massachusetts Maximum Contaminant Level (MCL) for perchlorate is 2.0 ppb (see below #1). The Millbury Avenue Well has been taken out of service and is not currently providing water to the distribution system pending additional tests to confirm the presence of perchlorate. Confirmation samples are in process. No perchlorate was detected in the treated water delivered from the Jacques wells in Millbury; the Oak Pond Well is out of service.

#### Possible Health Effects

Perchlorate interferes with the normal function of the thyroid gland and thus has the potential to affect growth and development and could cause brain damage and other adverse effects, particularly in fetuses and infants.

#### What should I do?

1. Pregnant women, nursing mothers, infants, children up to the age of 12, and individuals with hypothyroidism should not consume drinking water containing concentrations of perchlorate that exceed the Maximum Contaminant Level of 2.0 ppb.
2. Ice cubes, juices, baby formula, and other beverages prepared before August 29 should be discarded.
3. The general population is advised not to drink the water if levels exceed 18 ppb.
4. If you are concerned about effects of previous exposure to perchlorate on your thyroid functions, you should contact your primary health care provider.

#### What happened? What is being done?

Perchlorate is an inorganic chemical widely used as an oxidizer in fireworks, blasting agents and in other industrial products. The last monitoring for perchlorate at the Millbury Avenue Well in September 2007 did not detect perchlorate in the water.

The Millbury Avenue Well was taken out of service at 2:30 PM. on August 28, 2008, and will remain out of service until the safety of the water from this well is confirmed. Aquarion is flushing the water mains to remove any residual perchlorate from the water system. Water for the Town of Millbury is being provided by the Jacques Wells, which are treated to remove perchlorate, and from the City of Worcester.

Aquarion is investigating the source of the contamination and evaluating next steps in cooperation with the Massachusetts Department of Environmental Protection. This incident underscores the need for everyone to be vigilant in protecting public water supplies and to report any suspicious activity or dumping near sources of supply.

**For more information and updates on the situation, please contact Aquarion Water Company at 800-928-3734.**

*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.*
